Mastering ChatGPT for Website Development

Build Professional Websites with ChatGPT, Codex & AI Image Generation

Zirlandia Milkovic · bookpilot.org

How to use these prompts

Each prompt is a starting point. Replace anything in [square brackets] with your own details, paste it into ChatGPT, and iterate. Ask for one file or one section at a time, test what you get in the browser, and always review AI-written code before it goes live: check it works on mobile, with a keyboard and with real content.

These prompts complement the workflows in *Mastering ChatGPT for Website Development*. They are not chapters of the book.

Planning

01 Project brief interviewer

Act as a senior web strategist. Interview me with one question at a time until you can write a one-page brief for my website: goal, audience, main action I want visitors to take, pages, tone and must-have features. Then write the brief.

02 Sitemap and page goals

Based on this brief: [paste brief]. Propose a sitemap of no more than 7 pages. For each page give its single goal, the sections in order and the call to action. Present it as a table.

03 Choose the stack

I am a [beginner/intermediate] developer. My site needs [features]. Compare three stacks (for example plain HTML/CSS/JS, Next.js + Tailwind, a static site generator) on learning curve, hosting cost and maintenance. Recommend one and explain why in five bullets.

04 Build plan in small steps

Split building this site into steps that each produce one file or one component I can test in the browser. Number them and say how I check each step works before moving on.

HTML & CSS

05 Semantic page skeleton

Write the semantic HTML5 skeleton for a [page type] page with header, nav, main, sections for [list] and footer. Use landmarks and one h1. No CSS yet. Comment each section.

06 Responsive layout, mobile first

Write mobile-first CSS for this HTML: [paste]. Breakpoints at 640px and 1024px. Use CSS Grid for the layout and Flexbox inside components. No frameworks. Explain each breakpoint in one line.

07 Design tokens

Create CSS custom properties for a design system: 2 brand colours [hex], neutrals, a type scale with 6 steps, spacing scale and border radius. Then restyle buttons and cards using only those variables.

08 Tailwind component

Build a responsive pricing section in Tailwind CSS with three plans, the middle one highlighted. Keep it accessible: real buttons, visible focus states, sufficient contrast. Return one HTML file.

09 Dark mode

Add a dark mode to this CSS [paste] that follows prefers-color-scheme and can be toggled with a button that remembers the choice in localStorage. Avoid a flash of the wrong theme on load.

JavaScript

10 Form validation

Write vanilla JavaScript client-side validation for this form [paste HTML]. Show inline error messages linked with aria-describedby, validate on blur and on submit, and never block submission silently.

11 Feature without libraries

Implement [mobile menu / tabs / accordion] in vanilla JS. Requirements: keyboard support, correct ARIA attributes, works without JS as a fallback. Explain the event handling in comments.

12 Fetch and render data

Write a JS module that fetches [endpoint] and renders the results as cards. Handle loading, empty and error states, and escape any text that comes from the API before inserting it.

13 Refactor for readability

Refactor this code [paste] into small named functions without changing behaviour. List every change you made and why, and point out anything you were unsure about.

SEO

14 Titles and meta descriptions

For each page in this sitemap [paste], write a title tag under 60 characters and a meta description under 155 characters that match search intent for [keyword]. Avoid keyword stuffing.

15 Structured data

Generate JSON-LD structured data for [LocalBusiness / Product / Article / Book] with these details [paste]. Only include properties I gave you; mark anything missing as TODO instead of inventing it.

16 Technical SEO checklist

Review this page's HTML [paste] for technical SEO: headings order, canonical, image alt text, internal links, Open Graph tags, robots meta. Return a table: issue, why it matters, fix.

17 Content cluster

My site is about [topic]. Suggest one pillar page and six supporting articles that answer real questions my audience asks. For each, give a working title and the main question it answers.

Copy & content

18 Hero section copy

Write five hero-section options for [business] aimed at [audience]: headline under 10 words, one-sentence subhead, button label. Make each option use a different angle (outcome, pain, speed, trust, curiosity).

19 Benefits, not features

Turn this feature list [paste] into benefit-led bullet points that tell the visitor what changes for them. Keep each under 15 words and avoid hype words like 'revolutionary'.

20 FAQ from objections

List the eight most likely objections a visitor has before [buying / booking / contacting]. Write a short, honest FAQ answer for each.

21 Image prompts that match the brand

Write three AI image-generation prompts for my hero image: brand colours [hex], mood [words], subject [subject]. Specify composition, lighting and aspect ratio 16:9, and leave space for text on the left.

Debugging & review

22 Explain the bug first

This code [paste] produces [actual result] instead of [expected result]. Before fixing anything, explain the most likely causes in order of probability and how I can confirm each in the browser DevTools.

23 Code review as a senior dev

Review this code as a strict senior developer: bugs, security issues, accessibility problems, performance and naming. Rank findings by severity. Do not rewrite the whole file.

24 What could break?

List every way this component could break in production: slow networks, empty data, very long text, small screens, missing JavaScript, screen readers. Suggest a test for each.

25 Performance pass

Here is my Lighthouse report summary [paste]. Give me the five changes with the biggest impact on load speed, with the exact code or configuration for each.

Accessibility

26 Accessibility audit

Audit this HTML [paste] against WCAG 2.2 AA. For each issue, give the success criterion, who is affected and the corrected code.

27 Keyboard and focus

Check that every interactive element in this page [paste] is reachable and usable by keyboard, has a visible focus style and a logical tab order. Fix what is missing.

28 Colour contrast fix

Check these colour pairs [text hex on background hex] for WCAG AA contrast (4.5:1 for body text, 3:1 for large text and UI). For any that fail, suggest the closest on-brand colour that passes.

29 Alt text that helps

Write alt text for these images given their purpose on the page [list images and context]. Mark purely decorative ones to use alt="" and explain why.

Launch

30 Pre-launch checklist

Create a pre-launch checklist for my site covering links, forms, mobile, accessibility, SEO, analytics, privacy notice, favicon, 404 page and backups. Make it a checkbox list I can work through in an hour.

Want the full workflow?

Mastering ChatGPT for Website Development takes you from brief to launch across eight complete projects. Available on Amazon in English, German and Portuguese. More at bookpilot.org.
